Explanation of XML Elements

<lodges>: This is the root element that contains all the lodge entries.

<lodge>: This element represents an individual lodge. It has an attribute id that uniquely identifies each lodge.

<name>: The name of the lodge.

<capacity>: The capacity of the lodge, indicating the number of people it can accommodate.

<cost_per_day>: The cost per day to stay at the lodge.

<booked>: A Boolean value (true or false) indicating whether the lodge is booked.

<image>: The filename of an image representing the lodge.

<description>: A description of the lodge.

XML Data Dictionary

ROOT ELEMENT

<lodges>: This is the root element that contains all the lodge entries. It does not have any attributes or content other than the child <lodge> elements.

Child Elements

<lodge>: Represents an individual lodge. Each lodge has several attributes and child elements that describe its properties. The <lodge> element has an attribute id that uniquely identifies each lodge.

ATTRIBUTES id: A unique identifier for the lodge. It is an attribute of the <lodge> element.

Child Elements of <lodge>

<name>: The name of the lodge.

DATA TYPE: STRING

Example: <name>Lodge 1</name>

<capacity>: The capacity of the lodge, indicating the number of people it can accommodate.

DATA TYPE: INTEGER

Example: <capacity>2</capacity>

<cost_per_day>: The cost per day to stay at the lodge, typically represented in the local currency.

DATA TYPE: INTEGER

Example: <cost_per_day>100</cost_per_day>

<booked>: A boolean value indicating whether the lodge is booked (true) or not (false).

DATA TYPE: BOOLEAN (TRUE/FALSE)

Example: <booked>>false</booked>

<image>: The filename of an image representing the lodge.

DATA TYPE: STRING (PATH TO THE IMAGE FILE)

Example: <image>lodge1.jpg</image>

<description>: A textual description of the lodge, providing additional details about its features and amenities.

DATA TYPE: STRING

Example: <description>A cozy lodge for two with a beautiful view.</description>
